WARNING: Although the high voltage (15,000 volts) is well protected, it is nevertheless suggested that you touch neither the box nor the tubes while in operation.

All tubes, as is usual, contain mercury vapor.

Starting from the left:
The first tube contains pure mercury vapor.
The second tube contains neon.
The third tube contains argon.
The other four tubes have a mineral coating deposited inside the glass, and the light given off is characteristic of the mineral.
